

Fork Positioner for Forklifts

Forklift Fork Positioner - A fork positioner is a device made out of high quality materials designed to be able to withstand the most difficult operations and work environments. This particular piece of equipment could enable the one driving to operate the forks hydraulically without leaving the seat. Side shifting units have the added ability to be able to laterally position the entire load or the arms in order to facilitate much more exact carrying and position in a quicker and much more effective manner.

The fork pocket is somewhat unique and could enable the one operating it to be able to securely sway the forks into position without any fear of damaging the positioning cylinders. This can allow the driver the choice to be able to execute simultaneous or independent fork movement, depending on the job requirement. For most lift trucks with non-OEM carriages, complete carriages are considered necessary. Standard OEM carriages can be transformed into fork positioners on available units.
